

# HEME WHITE PAPER

2.2V

# HEME Community Mutual autonomy Token

## 1. Summary

HEME: Full name Help Me Token. The richest man, Allen Musk fan's community autonomy Token. HEME is a decentralized, fast-deflationary token based on the Heco chain. The liquid mine pool is permanently locked and the smart contract ownership is handed over to the black hole address on the day it is issued. HEME uses 10% of each transaction as a deflationary mechanism. 1% will be distributed to all holders through smart contracts, 5% will return to the trading flow pool. 4% directly in black hole destruction. The more frequently you trade, the more dividends you get, the more token you hold, the more dividends you will get.

## 2. The Origin of HEME

HEME was launched by a group of community leaders. Initially, it was used for community members' reward, community voting, community management, etc.

HEME=SHIB+ token holder dividends mode!

Heco chain MDEX exchange debut!

Contract address:

0xE2A79251767B00B4f1631dC545348602224F0834

- HEME: Circulation is 1000 trillion
- Launch day: 500 trillion transfer Musk's address (Black hole address)
- Issue price: 0.000000000000001 USDT
- 3. HEME's mechanical vision
- HEME has achieved that each wallet address is a node, and each
- node is a mining machine, namely, The dividend model of holding
- coins. The more coins you hold, the more dividends you will get,
- The larger the transaction, the greater the dividend, which
- inspires the power of each node. It is speculated that by
- creating HEME, . Some people speculate that the issuer hopes
- to help the low-level groups who do not have the ability or
- resources to obtain more wealth opportunities in the real
- society to realize their hopes and dreams by creating a
- real-time efficient, unique and simple reward mechanism such
- as HEME
- 4. The unique charm of HEME
- HEME has a unique incentive and deflationary mechanism, as
- well as the characteristics of liquid trading mining.
- Specifically speaking: The HEME in the coin holder's wallet
- will receive the dividend reward for every transaction in the

- world according to the locked blockchain smart contract, which
- cannot be tampered with, To ensure that each token holder gets
- a fair income. It is a true decentralized smart contract
- dividend, and every transaction dividend is automatically
- transferred to the account wallet in real time. The larger the
- amount of HEME in the wallet, the larger the interest dividend,
- and the longer the wallet is stored, the larger the cumulative
- dividend, just as people deposit fiat money in the bank to earn
- interest. Regardless of the long-term holding or transfer,
- trading, circulation of HEME can generate income, this design
- is particularly conducive to personal and family asset
- allocation, can effectively resist the reduction of wealth
- caused by inflation, to achieve a steady appreciation of wealth
- assets

## 5. HEME's destruction mechanism and its value

Since all actions on the chain will trigger the destruction

of the dividend mechanism, The stock of HEME will decrease and

become more scarce with the passage of time and the frequent

increase in the number of transactions hence the name

Digital gold (digital gold), commonly used It is one of the

important components of personal and family asset allocation.

- In addition, HEME is also widely used by people for rewards
- after mission goals are achieved, charity support and
- interpersonal relations between courtesy and reciprocity,
- representing the sublimation of friendship and emotions
- between people as precious as gold. HEME was once crazy young
- and short. Video enthusiasts use it as a digital gift for
- marriage proposals. Therefore, HEME has quickly become an
- indispensable digital asset in the digital currency wallets of
- many young people.
- Due to the current extremely low price of HEME, many holders
- call it the poor man's Bitcoin.

## 1.1 HELPMETOKEN Community

- We have a strong core team from home and abroad to promote the HEME community.
- We create a group of high-quality joint innovations.
- We have a group of dedicated evangelists.

### HEME Creed

- I am a member of the HEME, the glory of the HEME is my glory, and the achievements of the black rice are my achievements. I will be strict with myself and create a first-class image! I will do my best to cultivate more talents! As long as the black rice is there, I have a future! As long as I am here, HEME will be strong!

## HEME International Community

### Mission:

- Lead Defi to build a consensus among millions of retail investors and serve everyone in the community.

### Vision:

- Become a top-tier community in the blockchain field.

### Values:

- Everyone participates, everyone realizes their dreams, I am for everyone, and everyone is for me!

## 1.2 DeFi

DeFi is the abbreviation of Decentralized Finance (distributed finance), generally refers to Encrypted assets, financial smart contracts and agreements built on the smart contract platform are currently

Mainly through the Ethereum network. The so-called "Defi", in short, is full use

Blockchain technology (including smart contracts, decentralized asset custody, etc.) will integrate traditional financial services

All the "intermediary" roles in the system are replaced by codes, so as to achieve the most efficient financial services.

The minimization of large-scale and cost.

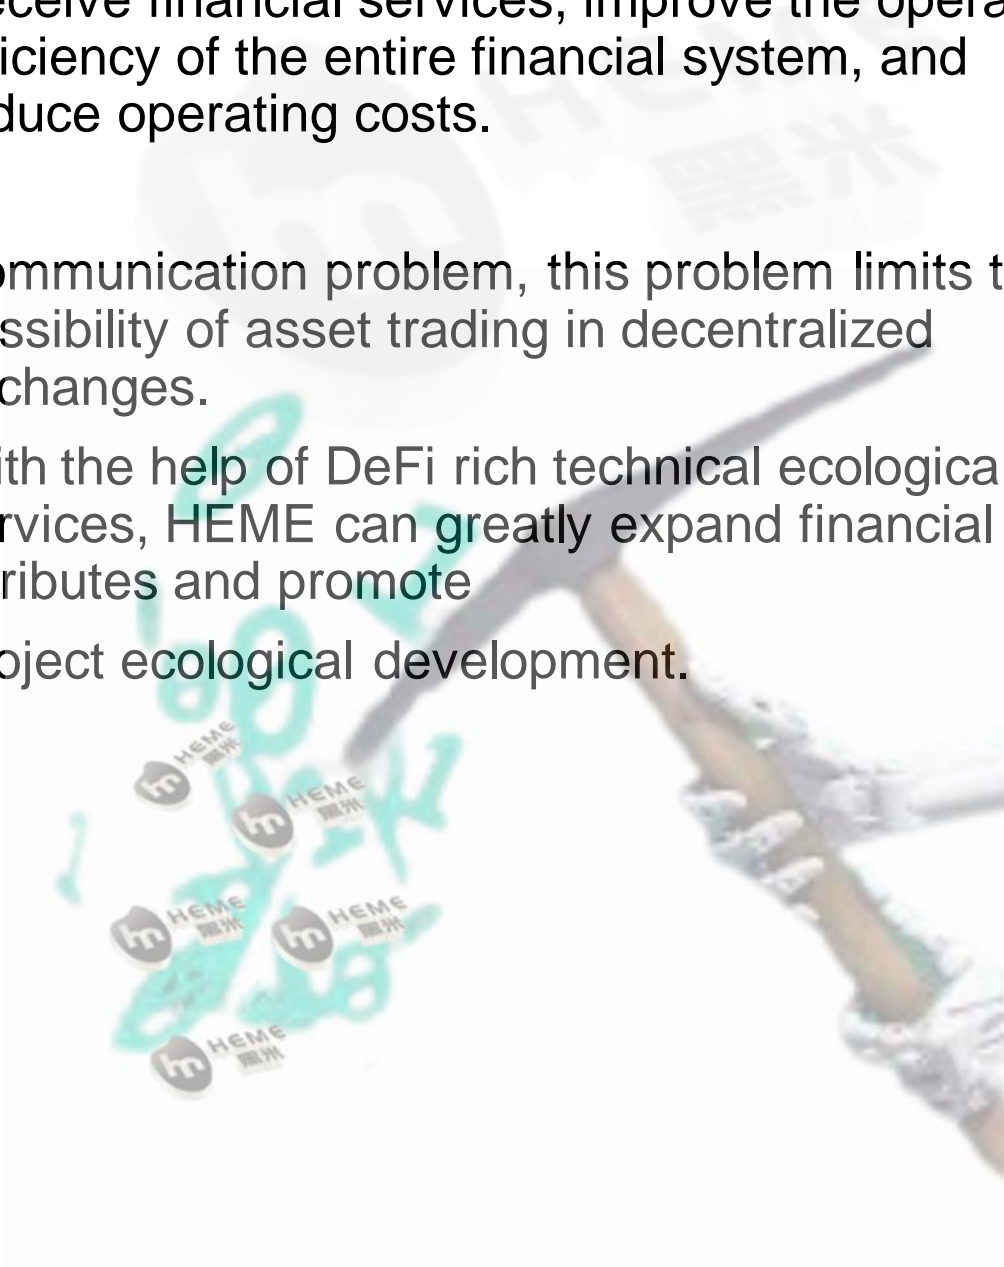

DeFi is to move traditional finance to the blockchain network, but compared to traditional finance, it

Decentralization is achieved through the blockchain, that is, the role of the middleman is removed, thereby reducing

- The huge cost brought by the intermediate links. The ultimate goal of DeFi is to realize the tokenization of assets.
- Use smart contracts to replace privileged institutions in the traditional financial
- Receive financial services, improve the operating efficiency of the entire financial system, and reduce operating costs.
- Communication problem, this problem limits the possibility of asset trading in decentralized exchanges.
- With the help of DeFi rich technical ecological services, HEME can greatly expand financial attributes and promote
- Project ecological development.

### 1.3 The relationship between HEME and DeFi

The most obvious benefit of liquidity pools is that they ensure a nearly continuous supply of liquidity for traders who want to use decentralized exchanges. They also provide an opportunity to profit from their cryptocurrency holdings by becoming a liquidity provider and earning transaction fees.

In addition, many projects and agreements will provide additional incentives for liquidity providers to ensure that their token pool remains large, thereby reducing slippage risk and creating a better trading experience. Therefore, this creates an opportunity to gain more revenue from liquidity mining reward tokens in exchange for becoming a liquidity provider.

- Liquid mining is an important fuse for defi's popularity. As early as a year ago, there were many defi-related projects, but what really made defi mining a hot spot was liquid mining. Although the market has experienced a sharp decline in the past two days, many liquid mining projects still have many benefits. Those investors who are involved in liquidity mining early on, are familiar with the relevant rules, and have sufficient funds, earn a lot of money.

## 2.1 Our goal

In the early stage, through free airdrops, a strong consensus HEME community was established. Everyone has a currency holding address of more than 1.5 million. The peer-to-peer global distributed HEME community until the formation of the HEME million times ecology. The biggest advantage of the DAO lies in its Global.

## 2.2 Our development:

HEME is the HECO ecological deflation token.

Blockchain enthusiasts jointly formed and developed a decentralized autonomous project. HEME is committed to HECO

The expansion of the financial properties and the extension of financial attributes are committed to making up for the shortcomings of the community currency. Through automation, it will support DeFi to gather reasonable wealth, cross-chain, decentralized finance, payment, and other landing applications, as well as market scenarios.

HEME token will start mining in future

Adding a pool to make a banker can mine value coin for free: HEME chain. Because the value coin empowers the HEME chain, the HEME currency is extremely safe (the contract is owned by a black hole, and there are no giant whales), and the community consensus is strong. If the new value currency launch, the price will grow up.

At the same time, the HECO chain reversely empowers HECO B. New value B has a scarce, unique global economic model, low circulation, and strong ecological attributes such as carrying and linking NFTs, metaverse, chain games, SWAP, and public chains. The explosive and ingenious mining logic settings will quickly thicken the main black rice coin mining pool, explode the value of black rice and the formation of ten thousand times the ecology.

## HEME will launch NFT in the future

A non-homogeneous token is a unit of data stored on a blockchain (digital ledger), which can represent unique digital items such as artworks.

It is an encrypted token, but unlike Bitcoin and other cryptocurrencies, it is not interchangeable.

A non-homogeneous token is to upload a file, such as an artwork, to the non-homogeneous token auction market.

This will create a copy of the file recorded on the digital ledger as a non-homogeneous token, which can be purchased and resold in cryptocurrency. Although artists can sell non-homogeneous tokens representing works, artists can still retain the copyright of the work and create more non-homogeneous tokens of the same work.

Buyers of non-homogeneous tokens cannot obtain exclusive access to works, nor can buyers obtain exclusive access to original digital files. Those who upload a certain work as a non-homogeneous token do not have to prove that they are original artists.

- What is "Gamefi "
- GameFi is one of the hottest topics in the cryptocurrency industry right now. Blockchain gaming looks poised to disrupt the [\\$175 billion](#) global video games market. Titles like Axie Infinity and its more than \$1 billion in total in-game asset sales have piqued the traditional gaming industry's interest — we're now seeing giants like Ubisoft [entering](#) the GameFi sector.
- In this article, we introduce the concept of GameFi to those not already familiar with it. We begin with a simple definition of the term before looking at the origins of blockchain gaming. Next, we consider some popular dynamics for gameplay monetization in existing GameFi titles, including play-to-earn features and asset ownership. We also introduce some of the most popular networks on which blockchain games are built.
- For those brand new to web 3.0 technology, we've included an explainer on how to get started in the world of GameFi. Before concluding with a look into blockchain gaming's future, we consider the concept of decentralized autonomous organizations, or DAOs, and how they are already shaping today's popular GameFi titles.

- 

GameFi refers to the financialization of video gaming. Similar to the popular crypto term DeFi, or decentralized finance, GameFi is a fusion of the words “game” and “finance.”

- GameFi is a rather broad term, and, as we’ll explain in this article, titles that are considered GameFi may have entirely different financial elements to one another. For example, some blockchain games reward players for completing in-game tasks while others may enable revenue generation from the various assets a player owns.
- It is important to note that GameFi is not gambling. The games we consider part of this emerging sector require players to leverage a mix of skill and strategy to generate income. Although luck may be a part of these games, it is not the predominant factor in determining who wins or is eligible for financial reward.
